Site Updates

Study done reporting effect on hair count of various doses of Propecia Yet another rare jewel - we continue to ramp up our online library of clinical studies that are of interest to you, with this additional study related to Propecia... This study goes in to a 12 month trial testing the effect various doses of finasteride (active ingredient in Propecia) had on hair counts. Propecia being 1mg, they attempted to see the differences between 1mg results, the results of a Placebo, and the results at 0.01mg, and 0.2mg. As part of the study there was also a 6 month test to see if taking 5mg daily would make any difference.... think it did?

To view the Microdosing Study, follow this link and look in the "Propecia Related" section.
